Maharashtra Institute of Dental Sciences & Research (Dental College), Latur

STERILIZATION METHOD:

In Maharashtra Institute of Dental Sciences & Research (Dental College), Latur the instruments and specialized equipment are segregated according to the Centers for Disease Control.

The classifications of critical, semi critical and noncritical are based on the following criteria:

- 1) Critical instruments are those used to penetrate soft tissue or bone, or enter into or contact the bloodstream or other normally sterile tissue. They should be sterilized after each use. Sterilization is achieved by steam under pressure (autoclaving), dry heat, or heat/chemical vapor. Critical instruments include forceps, scalpels, bone chisels, scalers and surgical burs.
- 2) Semi-critical instruments are those that do not penetrate soft tissues or bone but contact mucous membranes or non-intact skin, such as mirrors, reusable impression trays and amalgam condensers. These devices also should be sterilized after each use. In some cases, however, sterilization is not feasible and, therefore, high-level disinfection is appropriate.
- 3) Non-critical instruments are those that come into contact only with intact skin such as external components of x-ray heads, blood pressure cuffs and pulse oximeters. Such devices have a relatively low risk of transmitting infection; and, therefore, may be reprocessed between patients by intermediate-level or low-level disinfection. An intermediate-level disinfectant is EPA-registered as a "hospital disinfectant" and will be labeled for "tuberculocidal" activity (e.g., phenolics, iodophors, and chlorine-containing compounds).

Processing Instruments:

All critical and semicritical dental instruments that are heat stable should be sterilized after each use by steam under pressure (autoclaving), dry heat, or chemical vapor. Before sterilization or high-level disinfection, instruments are cleaned so that any debris is removed. Enzymatic and non-enzymatic solutions facilitate instrument cleaning. Heavy-duty gloves should be worn when handling contaminated instruments. Instruments should soak in water or disinfectant/detergent as soon as possible after use to prevent drying of debris. Instrument cassettes and mechanical cleaning is used to reduce direct handling of contaminated instruments. A rinsed and

dried instrument before sterilization protects them from contamination after they are removed from the sterilizer and during transport chair side or to storage.

Sterilization is recommended for all high-speed dental hand pieces, low-speed hand piece components used intraorally and reusable prophylaxis angles. We follow all the manufacturers' instructions for cleaning, lubrication and sterilization procedures to ensure the effectiveness of the sterilization process and the longevity of these instruments. High-speed and low-speed hand pieces produced today are heat tolerant, and many older heat sensitive models can be retrofitted with heat-stable components.

Biological Indicators:

Proper functioning of sterilization cycles should be verified by periodic use of spore tests called biologic indicators. Biologic indicators consist of highly resistant bacterial spores of *Bacillus* (*Geobacillus*) *stearothermophilus* (used to monitor steam and unsaturated chemical vapor sterilizers) or *Bacillus subtilis* (used for monitoring the dry heat sterilizer). The CDC recommends that all sterilized implantable devices be quarantined until the results of biological monitoring are known.

Principal
M. I. D. S. R. Dental College
LATUR

Chemical Indicators:

Chemical indicators (in the form of tape, strips, tabs and special markings on packaging material) indicate exposure to heat. Heat-sensitive chemical indicators that change color after exposure to heat do not guarantee sterilization but should be placed inside each pack, and on the outside of each pack when the internal indicator is not visible from the outside, to identify packs that have been processed through the heating cycle. Chemical indicators also placed in the center of a load of unwrapped instruments.

Flash Sterilization:

Flash sterilization is a method for sterilizing unwrapped instruments for immediate use. This cycle operates at a higher temperature for a shorter period of time than the normal sterilization cycle. The flash sterilization is not used routinely in the dental office to sterilize patient instruments—this process should only be used in unavoidable situations.

Cold Sterilization:

the use of liquid chemical germicides to sterilize instruments (i.e., "cold sterilization") are limited. For heat-sensitive instruments, this procedure may require up to 10 hours of exposure to a liquid chemical agent registered with the EPA as a "sterilant/disinfectant." Instruments sterilized in this manner are rinsed with sterile water, dried and placed in a sterile container (if not used immediately). Contact time is the single important variable distinguishing the sterilization process from high-level disinfection with FDA-cleared liquid chemical sterilants.

Instrument Processing:

Pre-cleaning and cleaning solutions

Enzymatic solutions- Removes blood and other proteinaceous material

Mechanical cleaners- Washers/disinfectors or ultrasonic cleaners

Sterilization Packaging Material

Cassette - Perforated metal or plastic/resin container used to house instruments

Paper/plastic pouch- For steam or unsaturated chemical vapour sterilizers and for storage of sterile instruments

Have built-in chemical indicator

Nylon tubing- For steam or dry heat sterilizers and for storage of sterile instruments

Wrap- For wrapping instruments and cassettes

Sterilizers

Steam autoclave- Uses steam under pressure to sterilize 250 F to 273 F (time varies depending on size of load and

autoclave) Good penetration of heat into packages Causes corrosion

Requires drying time

Oven-type dry heat sterilizer- Uses dry heat at 320 F for 1-2 hr No corrosion

Biological Monitoring

In-office spore testing system Test contains spore strips, culture tubes and proper incubator system

SOP of Fumigation

1) Protocol

- Stop the process of operation before fumigation or fogging.

- All materials, raw materials, finished goods, intermediates, and in-process goods related to products should be removed.
- All personal follow entry and exit procedures.
- Windows and doors should be closed. AC should be switch off before starting fumigation or fogging.

Kangan
Principal
M. I. D. S. R. Dental College
LATUR

- Status label 'Area under fumigation or fogging, Do not enter' shall be fixed on either side of the entrance.
- Intimation of fumigation and fogging and for additional rounds should be given to security.

Staff training and frequency

- In this hospital we train the staff of hospital once a year with proper guidance and precautions.
